

# Press Release ANGELS

## **First results of ANGELS needs analysis for France: Better safe than sorry**

ANGELS project (Augmented reality Network GEnErating Learning on Safety), is a training system for education and learning on safety and health at work, particularly in the hospital environment. ANGELS uses the augmented reality (computer system that can superimpose 3D image on a real image to combine real and virtual).

A summary note of the needs analysis of The Czech Republic, France, Italy and Spain will soon be available. It aims at evaluating the risks in standard and emergency situations in hospitals as well as the existing trainings. In addition, two groups consisting of health professionals and potential users were interviewed in each country to better determine what type of risk will be precisely covered in the training and what will the training include (cf. training kit).

Already, the interviews made in France with several public and private hospitals have enabled the identification of the main risks whether they are physical (wounds, falls, cuts, musculoskeletal disorders, bad positions, biological agents) or psychological (verbal violence, stress).

This project is run by the University Hospital « Fondazione PTV Policlinico Tor Vergata » in Rome, Italy, and the consortium also includes the Management and Human Resources company MF & PARTNERS CONSULTING, the Italian Human Resources and Development firm Entropy KN, the Italian computer company Inglobe Technology (IT), the training center in paramedical care NCONZO in Brno, Czech Republic, and the applied psychology, clinical psychology and biopsychology department of the Spain university of Jaume 1 in Castellon, near Valencia.
